## Ideal Gas Law Practice Worksheet

Solve the following problems using the ideal gas law:

1) How many moles of gas does it take to occupy 120 liters at a pressure of 2.3 atmospheres and a temperature of 340 K ?
2) If I have a 50 liter container that holds 45 moles of gas at a temperature of $200^{\circ} \mathrm{C}$, what is the pressure inside the container?
3) It is not safe to put aerosol canisters in a campfire, because the pressure inside the canisters gets very high and they can explode. If I have a 1.0 liter canister that holds 2 moles of gas, and the campfire temperature is $1400^{\circ} \mathrm{C}$, what is the pressure inside the canister?
4) How many moles of gas are in a 30 liter scuba canister if the temperature of the canister is 300 K and the pressure is 200 atmospheres?
5) I have a balloon that can hold 100 liters of air. If I blow up this balloon with 3 moles of oxygen gas at a pressure of 1 atmosphere, what is the temperature of the balloon?

## Solutions to the Ideal gas law practice worksheet:

The ideal gas law states that $P V=n R T$, where $P$ is the pressure of a gas, $V$ is the volume of the gas, $n$ is the number of moles of gas present, $R$ is the ideal gas constant, and T is the temperature of the gas in Kelvins.

Common mistakes:

- Students express $T$ in degrees celsius, rather than Kelvins. This can cause huge problems, especially when the temperature is below freezing.
- Students use the wrong value of R. You need to make sure that you have the right value of R for the units you're using. In this worksheet, $\mathrm{R}=0.08206$ L'atm $/ \mathrm{mol} \mathrm{K}$ - some teachers prefer using units of KPa rather than atmospheres, resulting in huge errors if the wrong $R$ is used.

1) $\quad 9.89$ moles
2) 34.9 atm
3) 274.5 atm
4) $\quad 243.7$ moles
5) $\quad 406.2 \mathrm{~K}\left(133.2^{0} \mathrm{C}\right.$ - a very hot day to blow up balloons!)
